

Roll Number: _____	
Thapar Institute of Engineering and Technology, Patiala	
Computer Science and Engineering Department	
BE(3 rd Year) September 30, 2022 MST	UML501: Machine Learning
Time: 2 Hours	Marks:25
Instructors: Dr. Singara Singh Kasana, Dr. Maninder Kaur, Dr. Jatin Bedi, Dr. Raman Goyal, Dr. Harpreet Singh, Ms. Swati	

Note: All questions are compulsory. All parts of a question must be answered in order.

Q1	Given the data in Table, reduce the dimensions from 2 to 1 using the Principal Component Analysis algorithm.	[5]												
	<table><tr><td>X₁</td><td>4</td><td>8</td><td>13</td><td>7</td></tr><tr><td>X₂</td><td>11</td><td>4</td><td>5</td><td>14</td></tr></table>	X ₁	4	8	13	7	X ₂	11	4	5	14			
X ₁	4	8	13	7										
X ₂	11	4	5	14										
Q2	Why regularization is needed in machine learning models? Derive the coefficients equation of ridge regularization for <u>multiple linear regression</u> using <u>gradient descent</u> optimization and discuss how the ridge regression can shrink the regression coefficients.	[5]												
Q3	The dataset of pass/fail in an exam for five students is given below: <table><tr><td>hours_study</td><td>Result (1= Pass, 0= Fail)</td></tr><tr><td>29</td><td>0</td></tr><tr><td>15</td><td>0</td></tr><tr><td>33</td><td>1</td></tr><tr><td>28</td><td>1</td></tr><tr><td>39</td><td>1</td></tr></table> If we use logistic regression as a classifier and assume the model is given by following function for passing the exam. $Y = (-64) + 2 \times \text{hours_study}$ Assume that no pre-processing is required (a) Calculate probability of pass for a student who studies 33 hours and compare the output with the actual Result. (b) How many hours a student should study to ensure probability of passing is 95% or more.	hours_study	Result (1= Pass, 0= Fail)	29	0	15	0	33	1	28	1	39	1	[5]
hours_study	Result (1= Pass, 0= Fail)													
29	0													
15	0													
33	1													
28	1													
39	1													

Q4

For the following confusion matrix of 4×4 ,

[5]

		True (Actual)			
		A	B	C	D
Predicted	A	25	48	90	70
	B	12	14	16	30
	C	88	40	17	11
	D	33	24	13	18

Calculate the following

- Precision with respect to each class (i.e. calculate separately for A, B, C and D respectively)
- Sensitivity with respect to each class (i.e. calculate separately for A, B, C and D respectively)
- Specificity for class A
- False Positive rate for class A

Q5

Consider the following data give the height in inches (X) and the weight in kg (Y) of a random samples of 10 students from a large group of students of age 17 years:

[5]

X	61	68	68	64	65	70	63	62	64	67
Y	112	123	130	115	110	125	100	113	116	125

- Estimate the regression equation using least square error method.
- What will be the mostly likely estimate of the weight of the student when the height is 69 inches?
